

Quiz 1 Practice

Name (print clearly): _____

Signature: _____

T-Square username (gtg, gth, msmith3, etc): _____

- Signing signifies you are aware of and in accordance with the **Academic Honor Code of Georgia Tech**.
- Calculators and cell phones are NOT allowed.
- This is a Python programming test. Where asked for Python statements or expressions you must print them exactly as they would be typed in a Python source file or interactive shell.

| Question | Points per Page | Points Lost | Points Earned | Graded By |
|----------|-----------------|-------------|---------------|-----------|
| Page 1 | 4 | - | = | |
| Page 2 | 13 | - | = | |
| Page 3 | 8 | - | = | |
| Page 4 | 10 | - | = | |
| Page 5 | 8 | - | = | |
| Page 6 | 10 | - | = | |
| Page 7 | 0 | - | = | |
| Page 8 | 0 | - | = | |
| TOTAL | 53 | - | = | |

1. True or False

In each of the blanks below, write “T” if the statement beside the blank is true, “F” otherwise.

- [1] (a) ____ Every Python value has a type such as `float` or `int`.
- [1] (b) ____ Python variables are statically typed, meaning that once you assign a value to a variable you can only assign new values of the same type. For example, after `x = 3.14` you can only assign `float` values to `x`.
- [1] (c) ____ The `+` operator means the same for `str` values as it does for `int` values.
- [1] (d) ____ `try = try + 1 # increment the number of tries` is a valid Python statement.

2. Expression Evaluation

For each expression below, write the value and then the Python data type of the evaluated legal expression in the space provided.

Expression: `7 / 2`

[1] (a) Calculated value: _____

[1] (b) Type: _____

Expression: `64 - 16 * 2`

[1] (c) Calculated value: _____

[1] (d) Type: _____

Expression: `'Ni' * 3`

[1] (e) Calculated value: _____

[1] (f) Type: _____

Expression: `1 // 2`

[1] (g) Calculated value: _____

[1] (h) Type: _____

Expression: `True and (1 == 2)`

[1] (i) Calculated value: _____

[1] (j) Type: _____

Expression: `1 if 2 else 3`

[2] (k) Calculated value: _____

[1] (l) Type: _____

3. **Multiple Choice** Circle the letter of the correct choice.

[2] (a) Given the following code:

```
capitals = {}  
capitals['Murica'] = 'Warshington'  
capitals['Germany'] = 'Bonn'  
capitals['France'] = 'Paris'  
capitals['Engalnd'] = 'London'  
capitals['Germany'] = 'Berlin'
```

What is capitals['Germany']?

- A. 'Berlin'
- B. 'Sweden'
- C. 'Paris'
- D. 'London'

[2] (b) What is wrong with this code:

```
n = 5  
while n > 0:  
    print(n)  
n -= 1
```

- A. The variable `n` is declared outside the scope of the `while` loop.
- B. The `while` loop never finishes.
- C. The variable `n` is the wrong type.
- D. There is nothing wrong with this code.

[4] (c) What is the value of `list(enumerate(['today', 'is', 'a', 'great', 'day']))`?

- A. `[('today', 1), ('is', 2), ('a', 3), ('great', 4), ('day', 5)]`
- B. `[todayisagreatday]`
- C. `[(0, 'today'), (1, 'is'), (2, 'a'), (3, 'great'), (4, 'day')]`
- D. the location of an iterable object

4. Tracing

Consider the following program:

```
x = 1
y = x
y = 2
print(x)
print(x == y)
```

- [5] (a) What is printed when this program is run from the command line?

Consider the following program:

```
counter = 0;

def incrementCounter():
    global counter
    counter += 1
    return True

a = True
b = False;
if b or incrementCounter():
    print("Boo")
if (a or b) and incrementCounter():
    print("ya!")
print(counter)
```

- [5] (b) What is printed when this program is run from the command line?

5. **Short Answer**

[2] (a) What is the value of `"abcdefg"[1]`

[2] (b) What is the value of `"abcdefg"[-1]`

[2] (c) Write an expression that computes the average of a list of numbers `nums`.

[2] (d) Make the dictionary variable, `e2f`, that contains mappings from English words to their French equivalents. Use these words: dog is chien, cat is chat, and walrus is morse.

6. Complete the Method

- [5] (a) Fill in the code for the following method that takes a list of numbers and returns the number of even numbers in list argument. Your code should use a **for** statement.

```
def evens(nums):
```

- [5] (b) Fill in the code for the following method that takes a list of numbers and a number and returns **True** if the list contains the number, **False** otherwise. You will need a loop, and your loop must not execute more iterations than necessary, and you cannot use **break** or **continue** or the **in** operator.

```
def contains(nums, n):  
    // Your code goes here
```
